A. Option B

B. Option A

C. Option D

D. Option C

Answer: A

Explanation:

Explanation

The TransactionScope class establishes an ambient transaction in .NET. (An "ambient transaction" is one that lives in the current thread.) All connections opened within the TransactionScope participate in the transaction.

If different databases participate, the transaction is automatically elevated to a distributed transaction. The outcome of the transaction is controlled by setting the scope to complete to indicate a commit.

Note: Elastic database transactions for SQL DB enable applications to make atomic changes to data stored in several different SQL Databases.

Elastic database transactions targets the following scenarios:

* Multi-database applications in Azure: With this scenario, data is vertically partitioned across several databases in SQL DB such that different kinds of data reside on different databases. Some operations require changes to data which is kept in two or more databases. The application uses elastic database transactions to coordinate the changes across databases and ensure atomicity.

Etc.

Answer: C

Explanation:

Explanation

The Auto Scaling command

as-terminate-instance-in-auto-scaling-group <Instance ID>
will terminate the specific instance ID. The user is required
to specify the parameter as --decrement-desired-capacity. Then
Auto Scaling will terminate the instance and decrease the
desired capacity by 1. In this case since the minimum size is
2, Auto Scaling will not allow the desired capacity to go below
2. Thus, it will throw an error.
