NEW QUESTION: 3

Sie haben eine Microsoft SQL Server-Datenbank mit einer Tabelle namens Sales. Die Tabelle wird zum Abrufen von Daten verwendet und außerhalb der Geschäftszeiten aktualisiert.

Sie führen die folgende Transact-SQL-Anweisung aus:

Sie analysieren den Ausführungsplan für die Anweisung. (Klicken Sie auf die Schaltfläche "Ausstellen".)

Sie müssen einen Index hinzufügen, der die Leistung optimiert.

Wie soll die Transact-SQL-Anweisung ausgeführt werden?

Answer:

Explanation:

Explanation

Box 1:

Specifying the order in which key values are stored in an index is useful when queries referencing the table have ORDER BY clauses that specify different directions for the key column or columns in that index. In these cases, the index can remove the need for a SORT operator in the query plan; therefore, this makes the query more efficient.

The Database Engine can move equally efficiently in either direction. An index defined as (RejectedQty DESC, ProductID ASC) can still be used for a query in which the sort direction of the columns in the ORDER BY clause are reversed. For example, a query with the ORDER BY clause ORDER BY RejectedQty ASC, ProductID DESC can use the index.

Box 2:

You can include nonkey columns in a nonclustered index to avoid exceeding the current index size limitations of a maximum of 16 key columns and a maximum index key size of 900 bytes. The Database Engine does not consider nonkey columns when

calculating the number of index key columns or index key size.
