**NEW QUESTION: 1**

- A. Option C
- B. Option B
- C. Option D
- D. Option A

**Answer: C**

Explanation:

Debugging with IntelliTrace, available in Microsoft Visual Studio 2010 Ultimate, provides an enhanced picture of your application compared with traditional debuggers. Traditional

debuggers show you the state of your application at the current time with limited information about events that occurred in the past. You must either infer events that occurred in the past, based on the state of your application at the current time, or restart the application to re-create past events. With IntelliTrace, you can actually see events that occurred in the past and the context in which they occurred. This reduces the number of restarts that are required to debug your application and the possibility that an error will fail to reproduce when you rerun the application.

IntelliTrace extends and enhances the Visual Studio live debugging experience that you are used to. You still have access to all the Visual Studio debugger features that you are familiar with. IntelliTrace operates invisibly in the background, recording debug information. When you want to look back at a past state of your application, you can enter IntelliTrace mode. In this mode, you can navigate to various points in time where events of interest have been recorded.

**NEW QUESTION: 2**

A GIS technician has a polygon layer of land use type and a separate table that contains the definition of each land use type.

Several polygons have the same land use type.

How should the technician apply the land use type descriptions in the table to the polygon layer?

- A. Spatial Join
- B. Relate
- C. Relation Class
- D. Join

**Answer: D**

**NEW QUESTION: 3**

A security administrator has finished building a Linux server which will host multiple virtual machines through hypervisor technology. Management of the Linux server, including monitoring server performance, is achieved through a third party web enabled application installed on the Linux server.

The security administrator is concerned about vulnerabilities in the web application that may allow an attacker to retrieve data from the virtual machines. Which of the following will BEST protect the data on the virtual machines from an attack?

- A. The security administrator must install a software firewall on both the Linux server and the virtual machines.
- B. The security administrator must install the third party web enabled application in a chroot environment.
- C. The security administrator must install the data exfiltration detection software on the perimeter firewall.
- D. The security administrator must install anti-virus software

on both the Linux server and the virtual machines.

**Answer: B**
