NEW QUESTION: 1
You need to implement the Sales Progress website. Which service application should you create and
configure?
A. the Access Service 2010 service application
B. a Business Data Connectivity Service application
C. an Application Management Service application
D. the PerformancePoint Service application
Answer: D

NEW QUESTION: 2
You are designing a distributed application.
The application must store a small amount of information that is shared across all users and does not change frequently.
You need to configure the application to meet the requirements.
Which server-side state management options will achieve the goal? Each correct answer presents a complete solution. Choose all that apply.
A. Session state
B. Database support
C. Profile properties
D. Application state
Answer: B,D
Explanation:
Explanation/Reference:
Explanation:
A: SQL Database provides a relational database management system for Windows Azure and is based on SQL Server technology. With a SQL Database instance, you can easily provision and deploy relational database solutions to the cloud, and take advantage of a distributed data center that provides enterprise- class availability, scalability, and security with the benefits of built-in data protection and self-healing.
D: Application state is a data repository available to all classes in an ASP.NET application. Application state is stored in memory on the server and is faster than storing and retrieving information in a database.
Unlike session state, which is specific to a single user session, application state applies to all users and sessions. Therefore, application state is a useful place to store small amounts of often-used data that does not change from one user

to another.
Incorrect Answers:
B: Profile properties stores personal, not global, information.
C: Session state is not global. Session states handles user
information such as cookies, hidden fields, and query strings
are some client-side options to tracking user state D:
Application State does not exist in Azure.
