E.  $\frac{1}{4}$  of the data is retained.

**Answer: C**

**NEW QUESTION: 2**

Each day, after all processing is finished, a bank performs a backup of its online deposit files and retains it for 7 days. Copies of each day's transaction files are not retained. This approach is:

A. Valid, in that having a week's worth of backups permits recovery even if one backup is unreadable.

B Risky, in that restoring from the most recent backup file would omit subsequent transactions.

C Valid, in that it minimizes the complexity of backup/recovery procedures if the online file has to be restored.

B. Risky, in that no checkpoint restart information is kept with the backup files.

**Answer: B**

Explanation:

At appropriate intervals, the disk files should be copied on magnetic tape so that restart procedures can begin at those points if data are lost or destroyed. However, not retaining each day's transaction files is risky because information processed since the last backup file was created will be lost.

**Answer: B**

Explanation:

Explanation  
The trunk still forms with mismatched native VLANs and the traffic can actually flow between mismatched switches. But it is absolutely necessary that the native VLANs on both ends of a trunk link match; otherwise a native VLAN mismatch occurs, causing the two VLANs to effectively merge.  
For example with the above configuration, SW1 would send untagged frames for VLAN 999. SW2 receives them but would think they are for VLAN 99 so we can say these two VLANs are merged.
