**NEW QUESTION: 2**

There is no way to completely abolish or avoid risks, you can only manage them. A risk free environment does not exist. If you have risks that have been identified, understood and evaluated to be acceptable in order to conduct business operations. What is this this approach to risk management called?

- A.** Risk Mitigation
- B.** Risk Acceptance
- C.** Risk Transference
- D.** Risk Avoidance

**Answer: B**

Explanation:

Risk management provides a mechanism to the organization to ensure that executive management knows current risks, and informed decisions can be made to use one of the risk management principles: risk avoidance, risk transfer, risk mitigation, or risk acceptance,

Risk Acceptance is when the risk has been identified, understood and evaluated to be acceptable in order to conduct business operations. Acceptance goes hand-in-hand with mitigation but they're slightly different.

At the end of the day, there is always a particle of risk we must undertake to perform business in a complex computing world. Whether it is operating a website, hosting a VPN connection or

connections for employees to the open internet, there is risk. Managers can either accept, avoid or transfer risk to another party. Either way, risk must be dealt with to conduct business operations.

The following answers are incorrect:

**Risk Avoidance:** Avoiding risk is when we avoid it altogether to deal with the risk. Whether it is by not hosting a website, not operating your own web proxy or any other computing task. Choosing not to perform the process is risk avoidance. This isn't correct because accepting risk is clearly not avoiding the risk.

**Risk Transference:** When we transfer risk, we pay someone else to undertake the risk on our behalf so that we may conduct operations, benefit from the risk but don't undertake the risky operation ourselves. Accepting the risk is different from

transferring the risk to another organization apart from your own in that you're not accepting it at all. Someone else does for you.  
Risk Mitigation: Mitigating risk means you accept it AND work around the risk to benefit from it. A good example could be a locked down web server or firewall. You benefit from the service they provide but mitigate risks involved by technical measures. Mitigation is incorrect because it goes beyond merely accepting the risk by mitigating the risk to make it more acceptable.

### **NEW QUESTION: 3**

Your network contains a Hyper-V host named Hyperv1 that runs Windows Server 2012 R2. Hyperv1 has a virtual switch named Switch1.

You replace all of the network adapters on Hyperv1 with new network adapters that support single-root I/O virtualization (SR-IOV). You need to enable SR-IOV for all of the virtual machines on Hyperv1.

Which two actions should you perform? (Each correct answer presents part of the solution. Choose two.)

- A.** On each virtual machine, modify the Advanced Features settings of the network adapter.
- B.** On each virtual machine, modify the Hardware Acceleration settings of the network adapter.
- C.** Delete, and then recreate the Switch1 virtual switch.
- D.** On each virtual machine, modify the BIOS settings.
- E.** Modify the settings of the Switch1 virtual switch.

**Answer: B,C**

Explanation:

The first step when allowing a virtual machine to have connectivity to a physical network is to create an external virtual switch using Virtual Switch Manager in Hyper-V Manager. The additional step that is necessary when using SR-IOV is to ensure the checkbox is checked when the virtual switch is being created. It is not possible to change a "non SR-IOV mode" external virtual switch into an "SR-IOV mode" switch. The choice must be made at switch creation time. Thus you should first delete the existing virtual switch and then recreate it.  
E: Once a virtual switch has been created, the next step is to

configure a virtual machine. SR-IOV in Windows Server "8" is supported on x64 editions of Windows "8" as a guest operating system (as in Windows "8" Server, and Windows "8" client x64, but not x86 client). We have rearranged the settings for a virtual machine to introduce sub-nodes under a network adapter, one of which is the hardware acceleration node. At the bottom is a checkbox to enable SR-IOV.
