1. Which of the following is a valid IP address?

- A. 5.2.1.1
- B. 192.168.1.1
- C. 20.10.1.1
- D. 1.0.1.1
- E. CMMI1.1.1.1
- F. 1.1.1.1
- G. 1.1.1.1
- H. 1.1.1.1

**Answer: A, B, E**

**NEW QUESTION: 2**

Your network consists of one Active Directory domain. All servers run Windows Server 2008 R2. You plan to publish a Web site on two Web servers.

You need to recommend a solution for the deployment of the two Web servers.

The solution must provide the following requirements:

- \* Session-state information for all users
- \* Access to the Web site if a single server fails
- \* Scalability to as many as seven Web servers
- \* Support for multiple dedicated IP addresses for each Web server

what should you recommend?

- A. Install failover clustering on each Web server.
- B. Install Network Load Balancing on each Web server.
- C. Assign multiple bindings in Internet Information Services (IIS).
- D. Create managed handler mappings in Internet Information Services (IIS).

**Answer: B**

Explanation:

Scalability is the operative word here.

Network Load Balancing servers (also called hosts) in a cluster communicate among themselves to provide key benefits, including:

Scalability. Network Load Balancing scales the performance of a server-based program, such as a Web server, by distributing its client requests across multiple servers within the cluster. As traffic increases, additional servers can be added to the cluster, with up to 32 servers possible in any one cluster.

High availability. Network Load Balancing provides high availability by automatically detecting the failure of a server and repartitioning client traffic among the remaining servers within ten seconds, while providing users with continuous service.

IP Addresses

Once Network Load Balancing is enabled, its parameters are configured using its Properties dialog box, as described in the online help guide. The cluster is assigned a primary IP address, which represents a virtual IP address to which all cluster hosts respond. The remote control program provided as a

- A. ã•¯ã•„
- B. ã•„ã•„ã•^

**Answer: A**

Explanation:

Explanation

We use the Azure Premium Key Vault with Hardware Security Modules (HSM) backed keys.

The Key Vault has to be in the same region as the VM that will be encrypted.

Note: If you want to use a key encryption key (KEK) for an additional layer of security for encryption keys, add a KEK to your key vault. Use the Add-AzKeyVaultKey cmdlet to create a key encryption key in the key vault. You can also import a KEK from your on-premises key management HSM.
