Answer: C

Explanation:

Explanation

Option A and B are invalid because by default the Security Groups already block traffic. You can use NACL's as an additional security layer for the subnet to deny traffic. Option D is invalid since just changing the Inbound Rules is sufficient. The AWS Documentation mentions the following: A network access control list (ACL) is an optional layer of security for your VPC that acts as a firewall for controlling traffic in and out of one or more subnets. You might set up network ACLs with rules similar to your security groups in order to add an additional layer of security to your VPC. The correct answer is: Change the Inbound NACL to deny access from the suspecting IP
