NEW QUESTION: 1
A user's traffic traversing a Palo Alto Networks NGFW sometimes can reach
http://www.company.com. At other times the session times out.
The NGFW has been configured with a PBF rule that the user's traffic matches when it goes to
http://www.company.com.
How can the firewall be configured automatically disable the PBF rule if the next hop goes down?
A. Create and add a Monitor Profile with an action of Wait Recover in the PBF rule in question.
B. Create and add a Monitor Profile with an action of Fail Over in the PBF rule in question.
C. Enable and configure a Link Monitoring Profile for the external interface of the firewall.
D. Configure path monitoring for the next hop gateway on the default route in the virtual router.
Answer: D

NEW QUESTION: 2
A company has locations in North America and Europe. The
company uses Azure SQL Database to support business apps.
Employees must be able to access the app data in case of a
region-wide outage. A multi-region availability solution is
needed with the following requirements:
* Read-access to data in a secondary region must be available
only in case of an outage of the primary region.
* The Azure SQL Database compute and storage layers must be
integrated and replicated together.
You need to design the multi-region high availability solution.
What should you recommend? To answer, select the appropriate
values in the answer area.
NOTE: Each correct selection is worth one point.

Answer:
Explanation:

Explanation:
Box 1: Standard
The following table describes the types of storage accounts and
their capabilities:

Box 2: Geo-redundant storage
If your storage account has GRS enabled, then your data is
durable even in the case of a complete regional outage or a
disaster in which the primary region isn't recoverable.
Note: If you opt for GRS, you have two related options to
choose from:
GRS replicates your data to another data center in a secondary
region, but that data is available to be read only if Microsoft
initiates a failover from the primary to secondary region.
Read-access geo-redundant storage (RA-GRS) is based on GRS.
RA-GRS replicates your data to another data center in a
secondary region, and also provides you with the option to read
from the secondary region. With RA-GRS, you can read from the
secondary region regardless of whether Microsoft initiates a
failover from the primary to secondary region.
