NEW QUESTION: 2
On a corporate network, hosts on the same VLAN can communicate
with each other, but they are unable to
communicate with hosts on different VLANs. What is needed to
allow communication between the VLANs?
A. a router with an IP address on the physical interface
connected to the switch
B. a switch with a trunk link that is configured between the
switches
C. a switch with an access link that is configured between the
switches
D. a router with subinterfaces configured on the physical
interface that is connected to the switch
Answer: D
Explanation:
Different VLANs can't communicate with each other, they can
communicate with the help of Layer3 router. Hence, it is
needed to connect a router to a switch, then make the
sub-interface on the router to connect to the switch,
establishing Trunking links to achieve communications of
devices which belong to different VLANs.
When using VLANs in networks that have multiple interconnected
switches, you need to use VLAN trunking between
the switches. With VLAN trunking, the switches tag each frame
sent between switches so that the receiving switch
knows to what VLAN the frame belongs. End user devices connect
to switch ports that provide simple connectivity to
a single VLAN each. The attached devices are unaware of any
VLAN structure.
By default, only hosts that are members of the same VLAN can
communicate. To change this and allow inter-VLAN
communication, you need a router or a layer 3 switch.
Here is the example of configuring the router for inter-vlan
communication
RouterA(config)#int f0/0.1
RouterA(config-subif)#encapsulation ?
dot1Q IEEE 802.1Q Virtual LAN
RouterA(config-subif)#encapsulation dot1Q or isl VLAN ID
RouterA(config-subif)# ip address x.x.x.x y.y.y.y
